

Advice on diet for patients receiving contact x-ray brachytherapy for rectal cancer (Papillon)

It is beneficial to ensure that your rectum is as empty as possible during your Papillon radiotherapy session. Having an empty rectum is helpful in a number of ways:

- it helps your doctor to see the area to be treated more easily
- assists in making the procedure as straight forward as possible

In order to achieve this, you will need to modify your diet, starting three days before the day of the procedure. You will need to eat a diet that is low in fibre and avoid foods that increase the activity of your bowel. This type of diet is known as a “low residue diet”. You may notice that you need to empty your bowels less often and pass smaller amounts. A list of foods to avoid and those that are allowed can be found overleaf.

Before the procedure, you will be given a micro-enema (into the rectum) to ensure that your rectum is as empty as possible. .

On the day of the procedure

You should have a light breakfast e.g. cereal (those allowed on the list) or white toast and a light lunch e.g. white bread sandwich with lean meat, cheese or egg.

After the procedure is complete you can return to your normal diet. It may take several days to return to your usual bowel habit.
